

Vertical Write-up

Self-Serve Analytical Intelligence Platform with context to Payments, Banking, FinServ Industry

1. Payments Industry

Industry Context

Payments systems handle **high-volume, real-time transactions** (cards, UPI, gateways). Focus is on **speed, uptime, and success rate**.

Core Challenges

- Real-time failure analysis
- Transaction success rate drops
- Multi-dimensional debugging (gateway, issuer, region)
- Heavy dependency on data teams

Project Fit

Our system acts as a:

Real-time operational intelligence layer

Users can directly ask:

- “Why did success rate drop today?”
- “Which gateway is failing most?”

Key Nuances

Aspect	Payments Requirement	System Alignment
Time Sensitivity	Seconds-level decisions	Fast NL → SQL + caching

Data Volume	Millions of txns/day	Efficient query engine
Metrics	Derived (success rate, auth rate)	Business glossary mapping
Debugging	Root cause analysis	Hypothesis engine
Compliance	PCI, PII masking	Governance layer

Conclusion

In payments, the system becomes a **real-time analytics brain**, reducing downtime and improving transaction performance.

2. Banking Industry

Industry Context

Banking is **highly regulated, structured, and risk-sensitive**. Focus is on **accuracy, compliance, and auditability**.

Core Challenges

- Risk & fraud analysis
- Customer insights
- Loan performance tracking
- Compliance reporting delays

Project Fit

Our system acts as a:

Governed decision-support system

Used by:

- Risk teams

- Relationship managers
- Compliance teams

Key Nuances

Aspect	Banking Requirement	System Alignment
Compliance	Strict regulations	Audit logs + RBAC
Data Sensitivity	Customer/PII data	Masking + access control
Explainability	Mandatory	SQL + reasoning trace
Data Type	Structured, relational	Schema-aware NL2SQL
Analysis Type	Historical, batch	Trend-based queries

Conclusion

In banking, the system becomes a **trusted analytics layer**, balancing intelligence with strict governance.

3. Financial Services Industry

Industry Context

Financial services include **investments, insurance, asset management**. Focus is on **optimization, prediction, and strategy**.

Core Challenges

- Portfolio analysis
- Risk-return evaluation
- Market trend interpretation
- Client-specific insights

Project Fit

Our system acts as an:

AI-powered analytical advisor

Users can ask:

- “Which portfolios underperformed and why?”
- “What are high-risk investments?”

Key Nuances

Aspect	Financial Services Requirement	System Alignment
Data Variety	Market + internal data	Extendable RAG layer
Metrics	Complex (ROI, risk)	Glossary + logic layer
Nature	Predictive + analytical	Future ML integration
Personalization	Client-specific insights	Context-aware queries
Accuracy	High-stakes decisions	Confidence scoring

Conclusion

In financial services, the system evolves into an **intelligent advisory platform**, enabling better strategic decisions.

Final Summary

Industry	Role of Our System
Payments	Real-time operational intelligence
Banking	Governed decision-support
Financial Services	AI-driven analytical advisor
